

14. Hillsborough River

Shoreline length: 147 km

Shore Types

Hillsborough River is a tidal estuary with a majority of wetland and low plain shores.

% Shore types within SMU

Governance, Infrastructure, and Economy

Hillsborough River SMU falls within several jurisdictions: the Town of Stratford (~1%), with the vast majority of the SMU including Mount Stewart, the Abegweit First Nation's Scotchfort Indian Reserve No. 4 (managed under First Nations authority), and an unincorporated area (~96% combined).

Areas with road infrastructure includes Miles, Clarks, and Fullertons Creeks; the Mount Stewart and Confederation Trail bridges over the Hillsborough River; and the Fort Augustus and Donagh Road crossings at the Augustus River.

Key infrastructure in this SMU includes the Abegweit Biodiversity Enhancement Hatchery. Other infrastructure includes Route 260 (Frenchfort Road at Miles Creek); Route 218 (Portage Road, east of McNally Shore Road); Main Street (Mount Stewart Bridge of Hillsborough River); the intersection of Routes 352 and 3TCH at Stratford/Cherry Hill; Route 21 (Fort Augustus Road and bridge at Clarks Creek); the Fort Augustus Road crossing at Augustus River; Route 257 (Donagh Road crossing at Augustus River); Fort Augustus Road at Mermaid; and Route 21 (Bunbury Road and bridge at Fullerton's Creek), and wastewater treatment ponds in Mount Stewart.

No major coastal economic drivers are noted. Legacy land use constraints include some densely developed small lots, and some unpaved roads.

Natural Assets and Heritage

Hillsborough River is home to the Glenfinnan Wildlife Management Area, Mount Stewart Wildlife Management Area, and Pisquid Wildlife Management Area. Protected and recreational sites include the Acadian Forest Park, Duffy's Beach, and the Fort Augustus Lions Club ball and soccer fields.

Planning and Policy Framework

Provincial rules apply in the unincorporated portion of this SMU and in Mount Stewart (a municipality with no planning). Land use and development standards include horizontal coastal building setbacks based on edge of feature and a calculation of erosion over time, building setbacks for dunes, and a requirement for a coastal buffer for new subdivisions. There are no specific flood elevations identified in regulations, but coastal hazard assessments are typically conducted. Stratford has municipal planning authority. Current planning documents apply watercourse and wetland regulations in all zones, including an O2 Reserve Zone — not shown on the zoning map — whose boundaries are interpreted to include any area defined as a Wetland or Watercourse, plus the area within 60 metres (197 feet) of a Wetland or Watercourse. Draft documents currently out for consultation would add vertical elevation requirements for habitable floors. The Abegweit First Nation manages land use within the Scotchfort Reserve under its own authority, separate from municipal or provincial planning.

Sediment transport

Sediment transport rates and associated downdrift risk across the SMU are low.

Coastal Flood and Erosion Risk

Coastal flooding is the prevailing hazard for the area. The following flood risk indicator is based on the even with 1% annual exceedance probability (100-year return) with increasing amounts of sea level rise (SLR). The erosion risk indicator is based on potential future shoreline change for areas with historical data, not including salt marshes.

Estimated number of buildings and length of road at risk [per km shoreline].

	FLOOD RISK				EROSION RISK		
	Present	Short-term 0.3m SLR (2050)	Medium-term 0.6m SLR (2080)	Long-term 1.2m SLR (2130)	Short-term (~2050)	Medium-term (~2080)	Long-term (~2130)
Buildings	50 [<1/km]	69 [<1/km]	90 [1/km]	147 [1/km]	2 [<1/km]	7 [<1/km]	32 [<1/km]
Roads	4258 m [29 m/km]	5902 m [40 m/km]	8045 m [55 m/km]	11123 m [75 m/km]	0	11 m [0 m/km]	53 m [0 m/km]

Proposed SMP Strategies

	Short-term	Medium-term	Long-term
Sea level rise range	0 – 0.3 m	0.3 – 0.6 m	0.6 – 1.2 m
Potential timeframe	2030 - 2050	2050 - 2080	2080 - 2130
14.00 Hillsborough River	NAI	MR	MR
Rationale	Given the initially low risk levels the proposed strategy is No Active Intervention. Mid- to long-term Managed Realignment will reduce flood risk to the limited number of vulnerable assets while preserving natural shorelines, including wetland habitat.		
14.01 Mount Stewart -PU	MR	MR	MR
Rationale	Managed Realignment will reduce risk to the limited number of vulnerable assets, allowing salt marsh migration up the estuary. Flood mitigation measures for vulnerable assets should be considered, including but not limited to wastewater treatment lagoons.		
14.02 Scotchfort 4 (Abegweit FN) -PU	NAI	NAI	NAI
	The strategies are suggested based on initial review of shoreline and risk information. Final strategies and local policies will be developed with the local authority.		

The table above shows how the recommended shoreline management unit (SMU) or policy unit (PU) strategy evolves across three planning epochs (Short-, Medium-, and Long-term) under increasing sea-level rise and erosion projections.

Adaptation strategies are preliminary recommendations subject to further development with feedback from community and government. These strategies are not approvals, commitments or policy determinations.
