

Alexandra Bay

Shoreline length: 33 km

Shore Types

Alexandra Bay is a bay located on the southeast end of PEI. Shore type characterized by a majority of wetlands, plus sloped armour along some properties in Stratford between Bellevue Point and Tea Hill Park.

% Shore types within SMU

low plain	bluff	sloped armour	cliff	wetland	vertical struct.	dunes	sandspit
13	4	7	7	69	0	0	0

Governance, Infrastructure, and Economy

Approximately 73% of this area is within the Rural Municipality of Alexandra; 12% is unincorporated; the remaining 15% is in the Town of Stratford. There are no key coastal economic drivers within the coastal

section of this region. Local and legacy land use constraints include several small, developed lots on unpaved roads along the coast. No key infrastructure is noted.

Natural Assets and Heritage

Tea Hill Park has beach access and a cricket field and playground. The Alexandra Point Rifle Range is also located in this area. The area is considered critical habitat for the threatened Bank Swallow.

Planning and Policy Framework

Provincial rules apply in the Alexandra and unincorporated portions of this SMU (85% combined). Land use and development is managed under provincial development standards, which include horizontal coastal building setbacks based on edge of feature and a calculation of erosion over time, building setbacks for dunes, and a requirement for a coastal buffer for new subdivisions. There are no specific flood

elevations identified in regulations, but coastal hazard assessments are typically conducted. Stratford has municipal planning authority. Current planning documents apply watercourse and wetland regulations in all zones, including an O2 Reserve Zone — not shown on the zoning map — whose boundaries are interpreted to include any area defined as a Wetland or Watercourse, plus the area within 60 metres (197 feet) of a Wetland or Watercourse. Draft documents currently out for consultation would add vertical elevation requirements for habitable floors.

Coastal Flood and Erosion Risk

Most of the low-lying shores are vulnerable to increasing flood hazards. Erosion hazard is highest along the exposed cliffs, bluffs, and low plains on the west end. The following flood risk indicator is based on the even with 1% annual exceedance probability (100-year return) with

Proposed SMP Strategies

The primary strategy for Alexandra Bay is No Active Intervention. In areas where infrastructure is at risk, managed realignment is proposed.

	Short-term	Medium-term	Long-term
Sea level rise range	0 – 0.3 m	0.3 – 0.6 m	0.6 – 1.2 m
Potential timeframe	2030 - 2050	2050 - 2080	2080 - 2130
Proposed SMU strategy	NAI	MR	MR
Rationale	Mid- to long-term MR will reduce risk to the limited number of vulnerable assets while preserving natural shorelines, including cliff and wetland habitat with increasing flood hazard.		

Note: the majority of Stratford lots and buildings between Bellevue Pt and Tea Hill Park have sloped armour and are outside the hazard zone. Policy on maintenance of armouring should be informed by community feedback, which may warrant a separate Policy Unit.

increasing amounts of sea level rise (SLR). The erosion risk indicator is based on potential shoreline change or salt marsh migration to future time horizons.

Number of at-risk buildings [N. per km shoreline]

	Present	0.3m SLR (2050)	0.6m SLR (2080)	1.2m SLR (2130)
SMU Alexandra Bay				
Flood risk	2 [<1/km]	3 [<1/km]	7 [<1/km]	13 [<1/km]
Erosion risk	NA	3 [<1/km]	3 [<1/km]	5 [<1/km]

Sediment transport - The estimated net sediment transport rate averaged across the SMU is low.
