

Murray Islands

Shoreline length: 12 km

Shore Types

Murray Islands is a cluster of islands including, Cherry Island and Gordons Islands, within Murray Harbour. Islands are constituted of low plain and wetland shore types connected by sand spits.

Governance and Planning

The islands are owned by the Government of Prince Edward Island and the Nature Conservancy of Canada. The NCC ownership indicates a conservation designation, though no named natural area or protected area is identified in available data.

The area is fully unincorporated. The islands are uninhabited, with no infrastructure, roads, or buildings. Land use and development is managed under provincial development standards. No legacy development constraints are noted

Natural Assets and Heritage

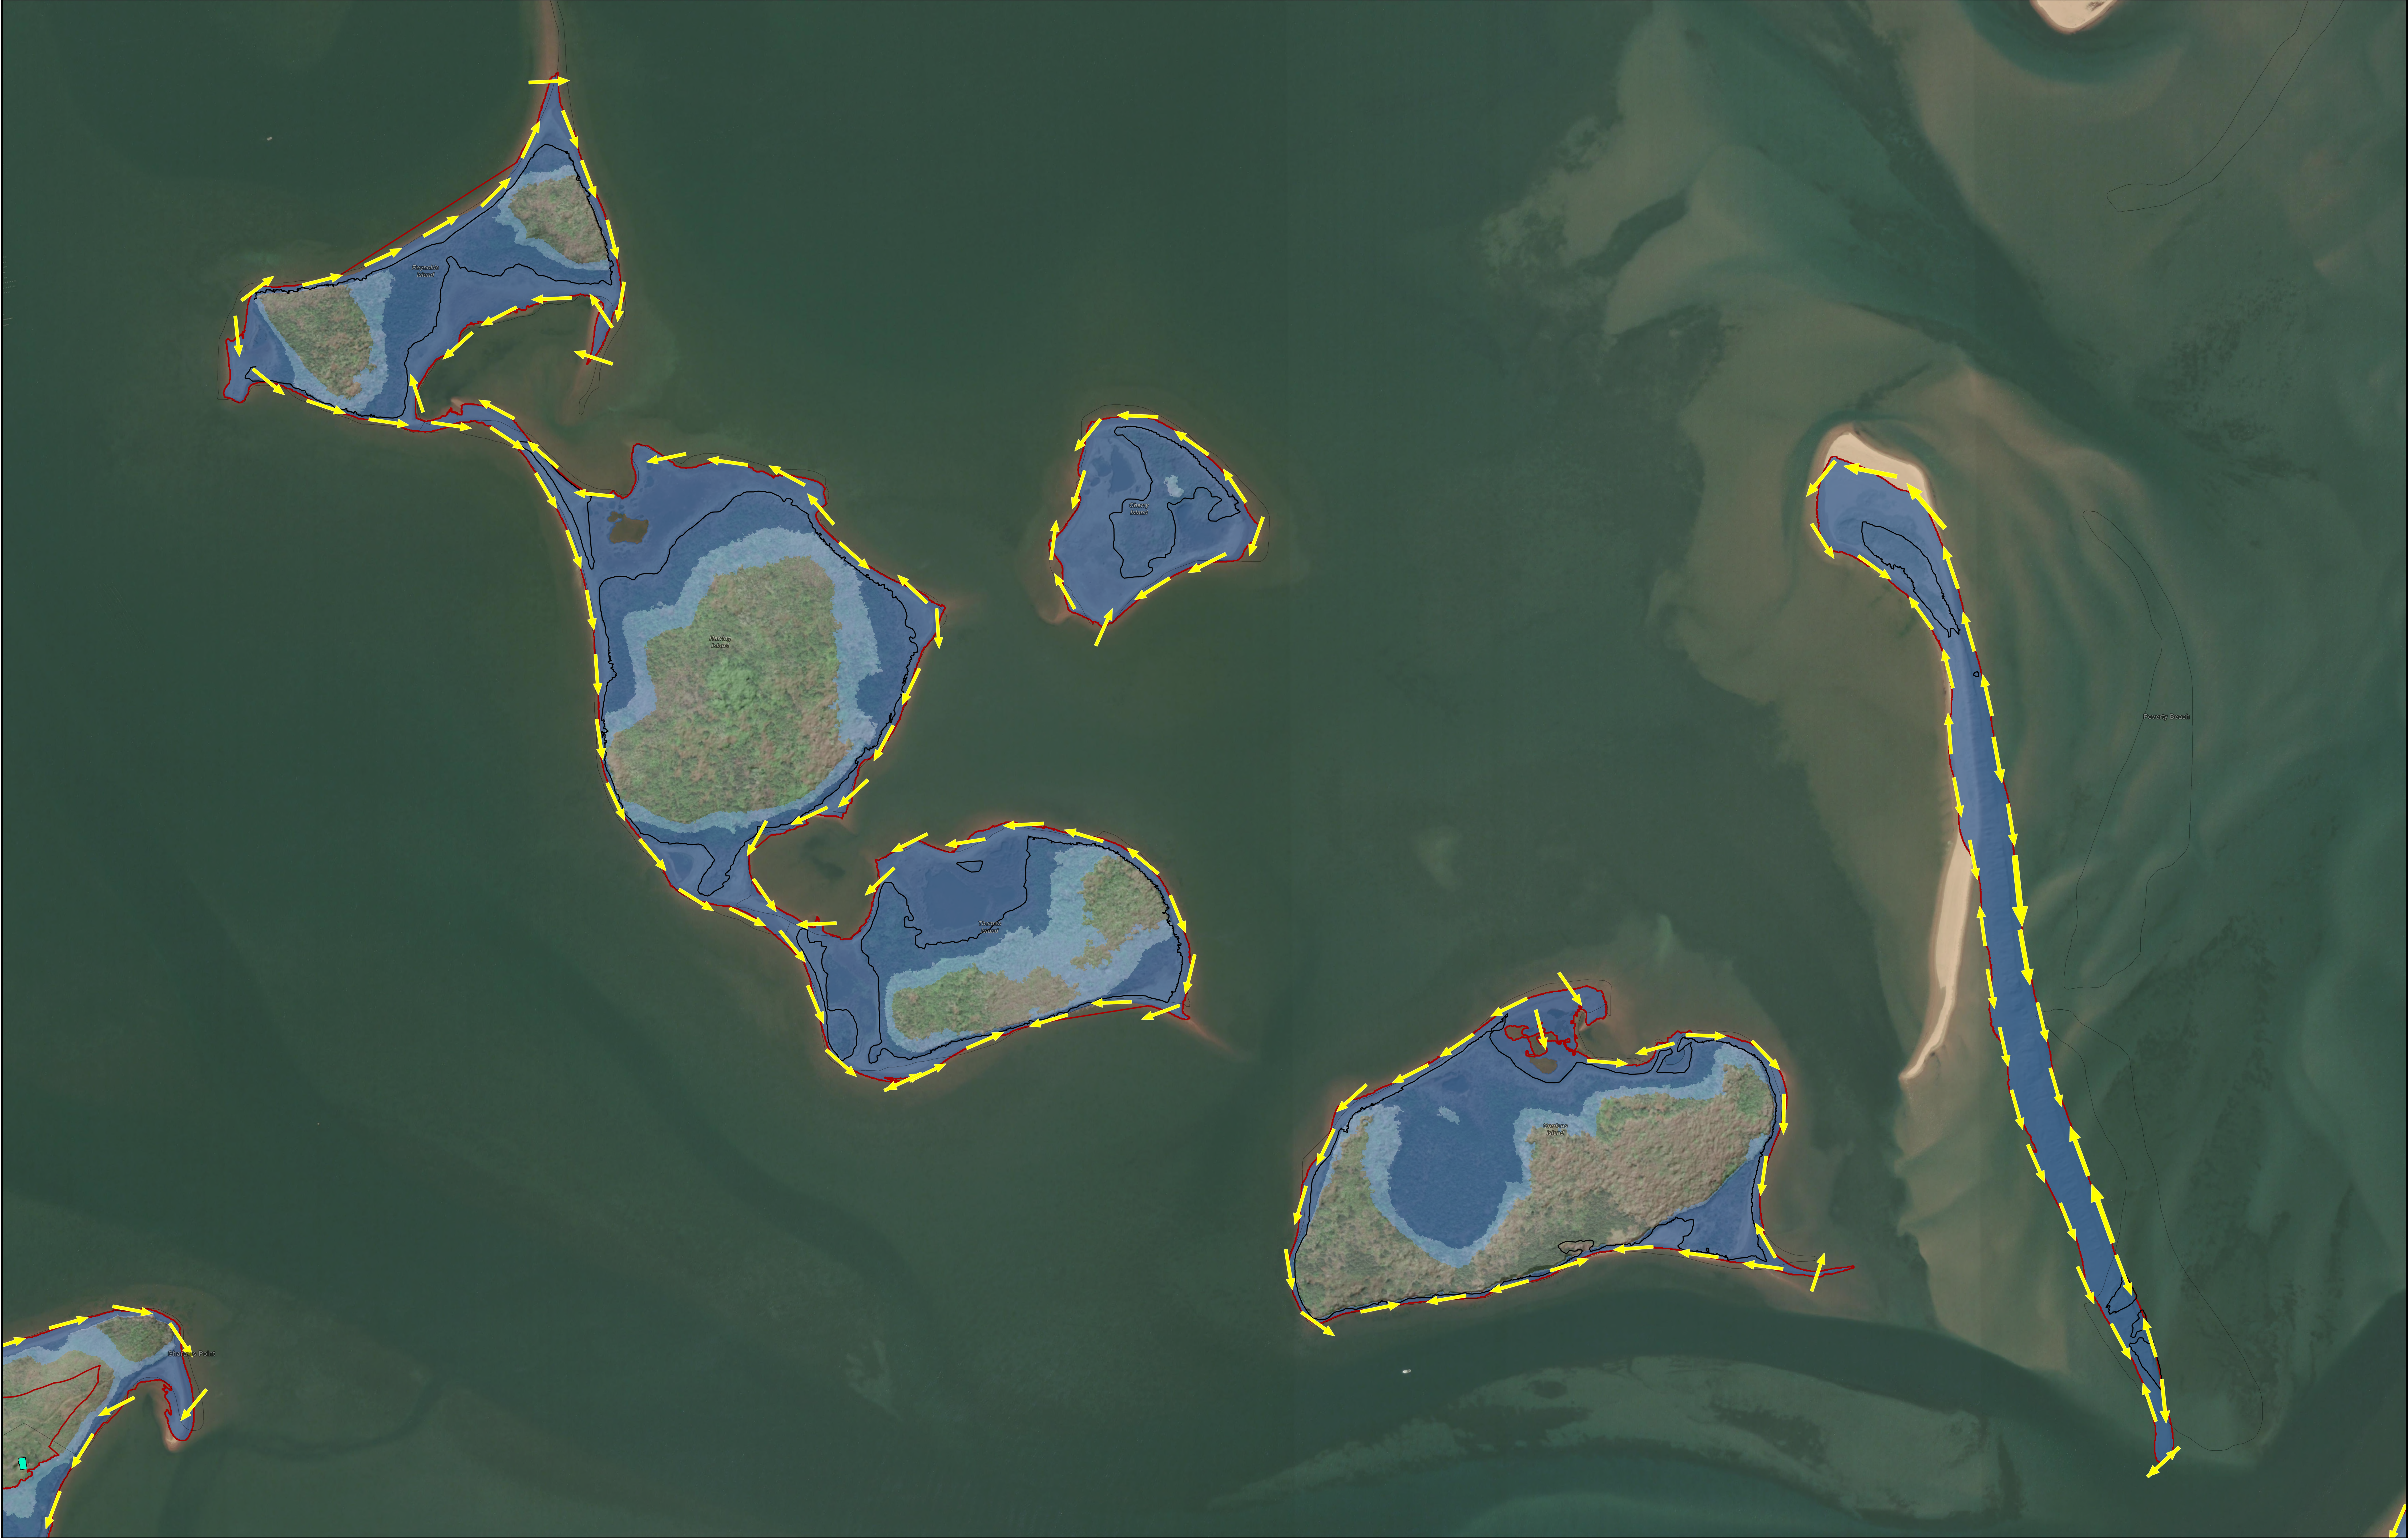

The shoreline includes critical habitat for bird species including the endangered Piping Plover.

Coastal Flood and Erosion Risk

Murray Islands are entirely undeveloped, therefore high flooding or shoreline change hazards do not translate into risk. The sediment transport around the inner islands is moderate, and highest along the outer barrier sandspit.

Proposed SMP Strategies

A No Active Intervention strategy is recommended for all three epochs. This will preserve natural habitat and shoreline processes, including the sheltering function for Murray Harbour. The local shoreline and hazard zone should remain natural, undeveloped.
